Lecture 12: Neural Networks

Sergei V. Kalinin

Types of Machine Learning

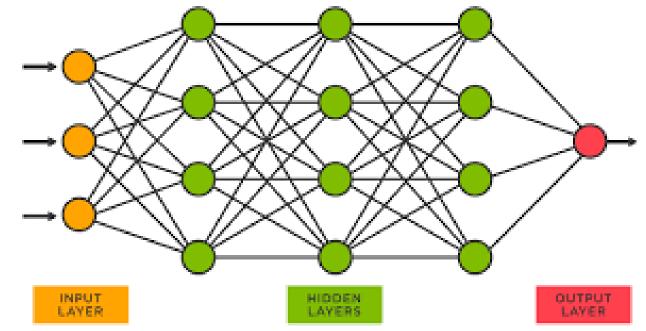

Supervised (inductive) learning

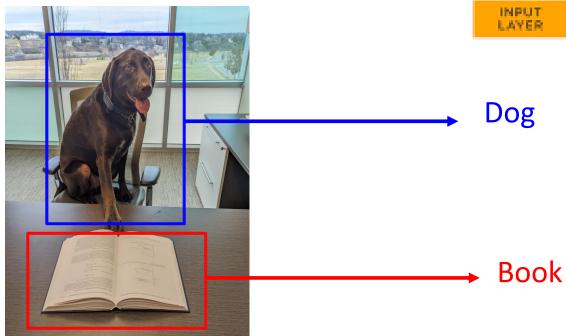

- Given: training data + desired outputs (labels)
- Unsupervised learning
- Given: training data (without desired outputs)
- Semi-supervised learning
- Given: training data + a few desired outputs
- Reinforcement learning
- Rewards from sequence of actions

Supervised Machine Learning

- Regression
- Classification
- Semantic segmentation
- Instance segmentation

• • •

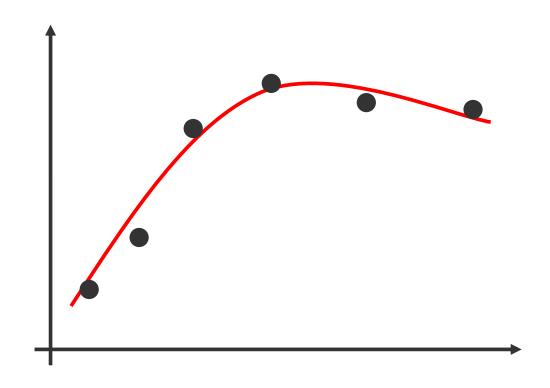

Classification

- Given $(x_1, y_1), (x_2, y_2), ..., (x_n, y_n)$
- Learn a function f(x) to predict y given x
- If y is categorical == classification

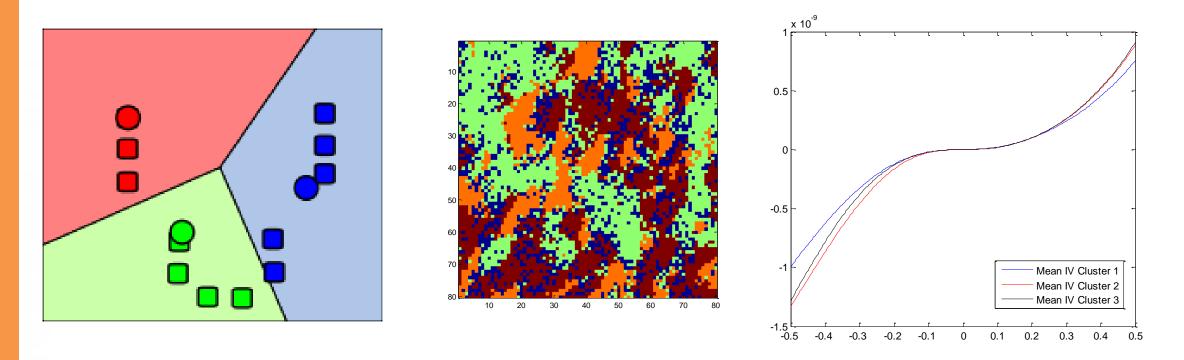

Application	Input Data	Classification
Medical Diagnosis	Noninvasive tests	Results from invasive
		measurements
Optical Character	Scanned bitmaps	Letter A-Z and digits 0-9
Recognition		
Protein Folding	Amino acid sequence	Protein shape (helices,
		loops, sheets)
Materials Discovery	Composition	Metal/Semiconducotr
Research Paper	Words in paper title	Paper accepted or rejected
Acceptance		

Regression

- Given $(x_1, y_1), (x_2, y_2), ..., (x_n, y_n)$
- Learn a function f(x) to predict y given x
- y is real-valued == regression

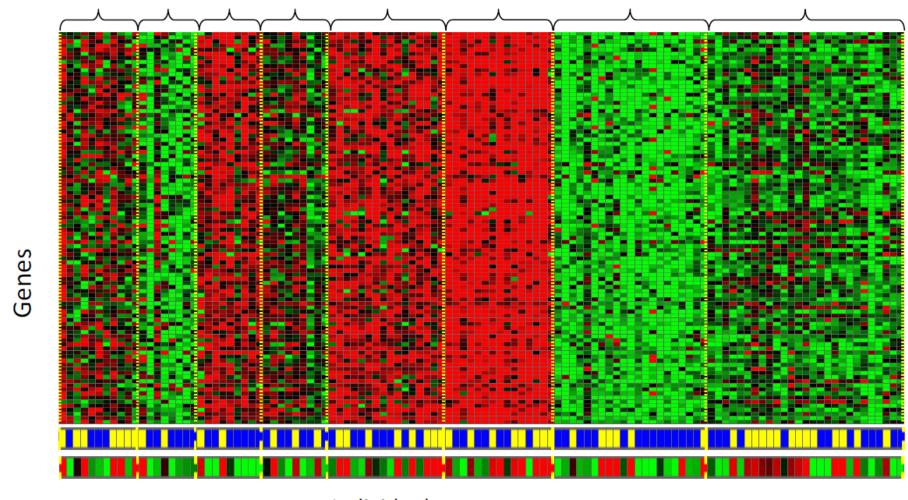

- Given $x_1, x_2, ..., x_n$ (without labels)
- Output hidden structure behind the x's
- E.g., clustering

Social network analysis

Astronomical data analysis

Number of signals are being produced simultaneously; with the objective of separating and following each source separately

Separated Sources

Reinforcement Learning

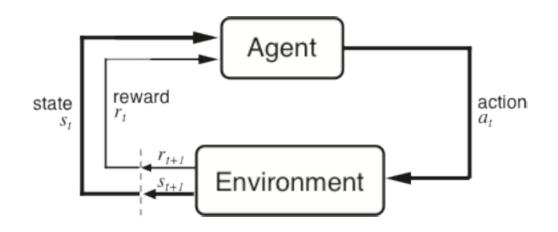

Given a sequence of states and actions with (delayed) rewards, output a policy – Policy is a mapping from states to actions that tells you what to do in a given

• Examples:

state

- Credit assignment problem
- Game playing
- Robot in a maze
- Balance a pole on your hand

RL: Agent and Environment

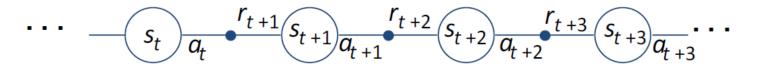

Agent and environment interact at discrete time steps : t = 0, 1, 2, K

Agent observes state at step t: $s_t \in S$

produces action at step t: $a_t \in A(s_t)$

gets resulting reward : $r_{t+1} \in \Re$

and resulting next state: s_{t+1}

Building Linear Neuron

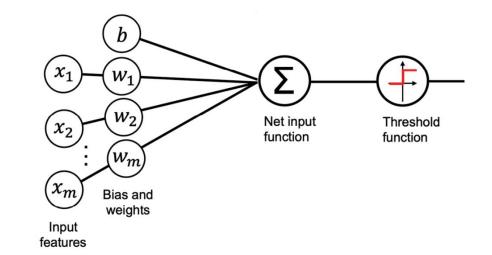

Input:
$$x = \begin{bmatrix} x_1 \\ \vdots \\ x_m \end{bmatrix}$$

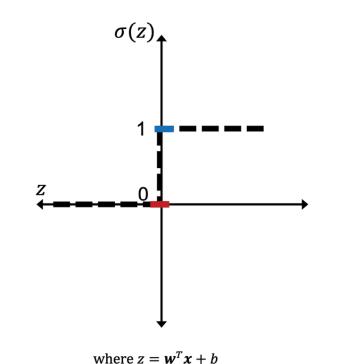

Weights:
$$\boldsymbol{w} = \begin{bmatrix} w_1 \\ \vdots \\ w_m \end{bmatrix}$$

Linear
$$z = w_1x_1 + ... + w_mx_m + b =$$

transform: $= w^Tx + b$

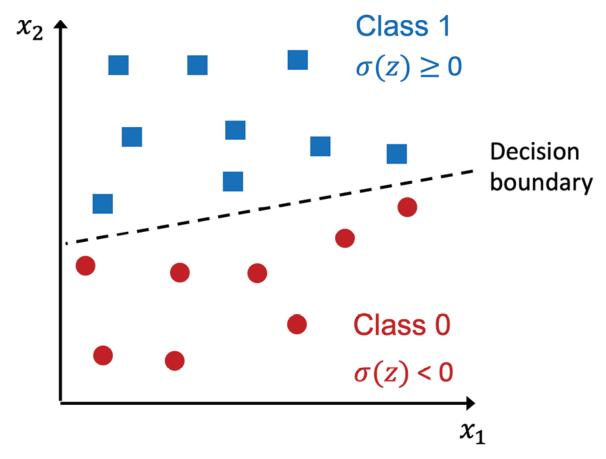

Output:
$$\sigma(z) = \begin{cases} 1 & \text{if } z \ge 0 \\ 0 & \text{otherwise} \end{cases}$$

From S. Raschka, Machine Learning with PyTorch and Scikit-Learn

Linear Neuron in 2D

Linear transform:

$$z = w_1 x_1 + w_2 x_2 + b$$

Line:

$$x_2 = -w_1/w_2 x_1 - b/w_2$$

From S. Raschka, Machine Learning with PyTorch and Scikit-Learn

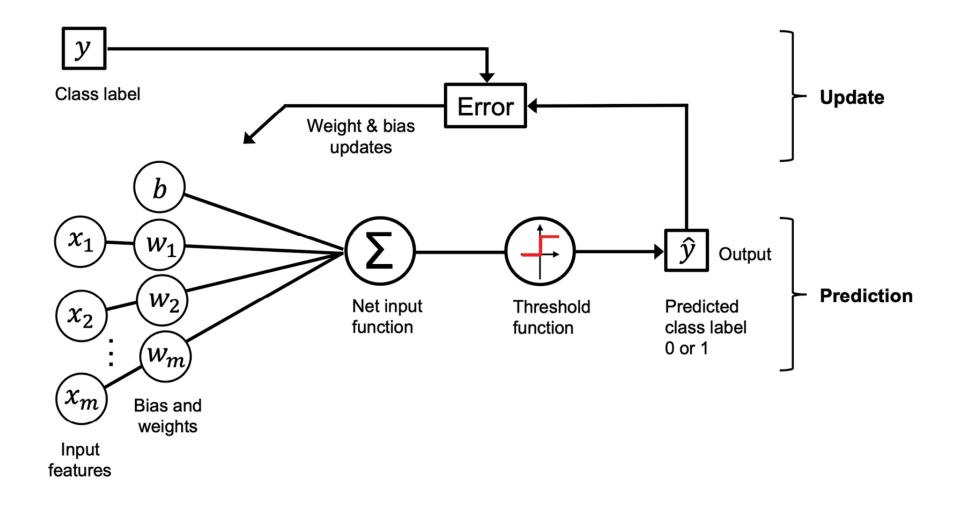

Training Linear Neuron

- Initialize the weights and bias unit to o or small random numbers
- For each training example, **x(i)**:
- Compute the output value, $y(i) = w^Tx(i) + b$
- Update the weights and bias unit: $w_j \coloneqq w_j + \Delta w_j$ and $b \coloneqq b + \Delta b$
- Where $\Delta w_j = \eta (y^{(i)} \hat{y}^{(i)}) x_j^{(i)}$ and $\Delta b = \eta (y^{(i)} \hat{y}^{(i)})$

Each weight, w_i , corresponds to a feature, x_i , in the dataset,

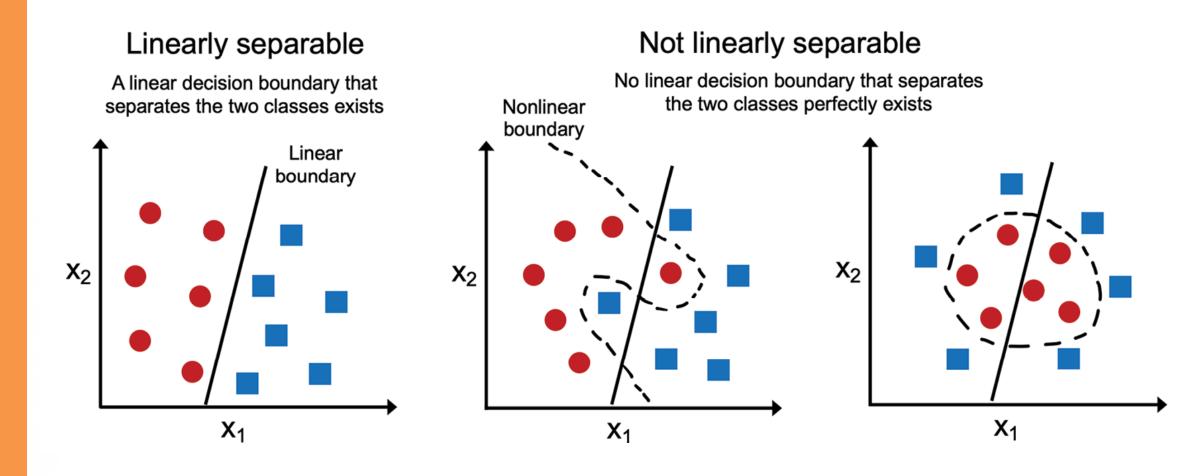

- η is the **learning rate** (typically a constant between 0.0 and 1.0),
- $y^{(i)}$ is the **true class label** of the *i*th training example,
- $\hat{y}^{(i)}$ is the **predicted class label**

Training Linear Neuron

What problems can perceptron solve?

From S. Raschka, Machine Learning with PyTorch and Scikit-Learn

Adaline

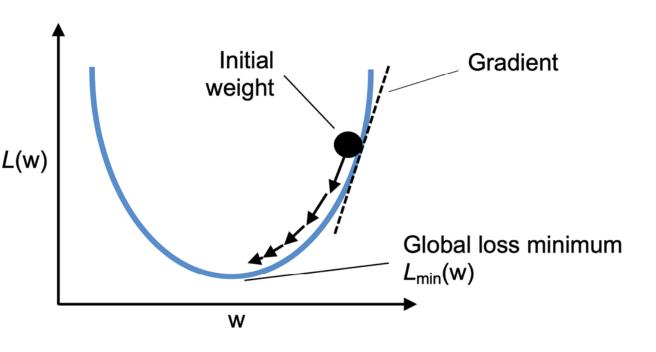

From S. Raschka, Machine Learning with PyTorch and Scikit-Learn

Adaline training

Loss function:

$$L(\mathbf{w}, b) = \frac{1}{n} \sum_{i=1}^{n} (y^{(i)} - \sigma(z^{(i)}))^{2}$$
 $L(\mathbf{w})$

Weights update:

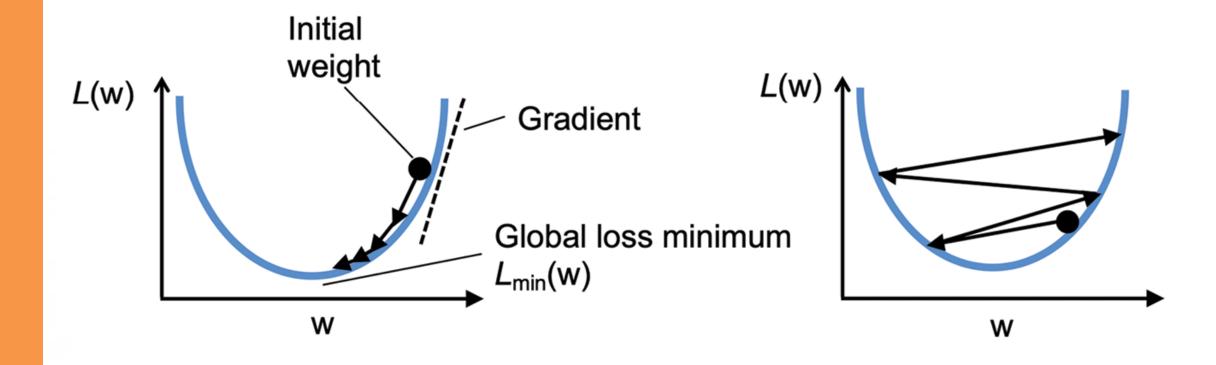

$$w:=w+\Delta w, \quad b:=b+\Delta b$$

Learning rule:

$$\Delta \mathbf{w} = -\eta \nabla_{\mathbf{w}} L(\mathbf{w}, b), \quad \Delta b = -\eta \nabla_{b} L(\mathbf{w}, b)$$

Role of learning rate

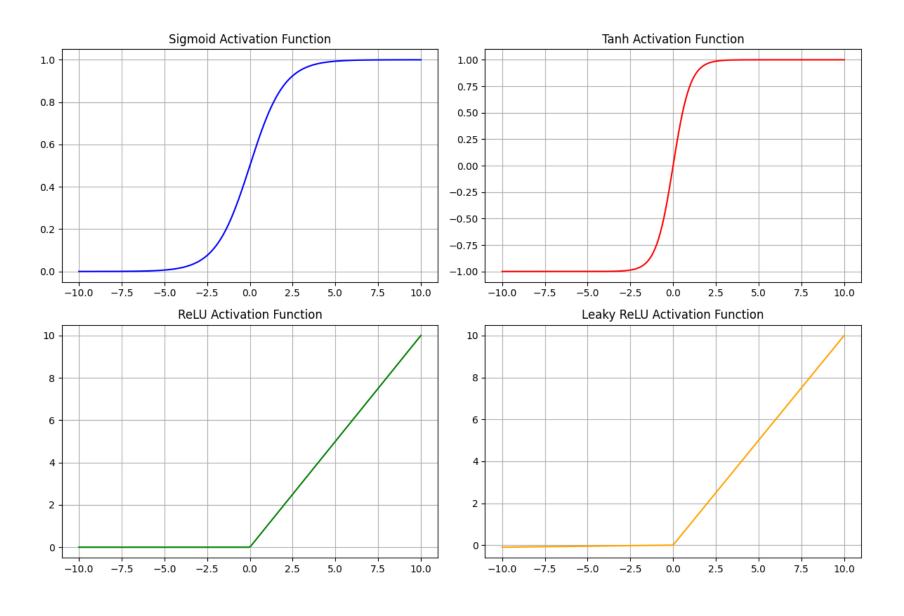

From S. Raschka, Machine Learning with PyTorch and Scikit-Learn

Putting Neurons Together

- Composed of multiple layers of artificial neurons.
- Each layer processes inputs received, applies a transformation (weights, biases, activation function), and passes the output to the next layer.
- Training a DNN involves adjusting weights and biases using backpropagation and a chosen optimization algorithm.
- The deep architecture enable the network to learn complex and abstract patterns in data.

Activation functions

Loss functions for supervised ML

A loss function, also known as a cost function, quantifies the difference between the predicted values and the actual target values. It guides the training of neural networks by providing a measure to minimize during optimization

Mean Squared Error (MSE): Used for regression problems.

$$MSE = \frac{1}{N} \sum_{i=1}^{N} (y_i - \hat{y}_i)^2$$

Measures the average squared difference between actual and predicted values

Cross-Entropy Loss: Used for classification problems.

$$CE = -\sum_{i=1}^{N} y_i \log(\hat{y}_i)$$

Measures the performance of a classification model whose output is a probability value between o and 1

- Loss functions provide the primary feedback signal for learning.
- The choice of loss function can significantly affect the model's performance and convergence

Backpropagation

Backpropagation is a mechanism used to update the weights in a neural network efficiently, based on the error rate obtained in the previous epoch (i.e., iteration). It effectively distributes the error back through the network layers

- **Forward Pass:** Calculating the predicted output, moving the input data through the network layers
- Loss Function: Determining the error by comparing the predicted output to the actual output
- **Backward Pass:** Computing the gradient of the loss function with respect to each weight by the chain rule
- **Weight Update:** Adjusting the weights of the network in a direction that minimally reduces the loss (gradient descent)

Input Data \rightarrow Forward Pass \rightarrow Calculate Loss \rightarrow Backward Pass \rightarrow Update Weights

How to not get lost?

- A vast array of network architectures ranging from Multilayer Perceptrons (MLPs) to Graph Neural Networks and Transformers
- Each architecture has unique characteristics suited for different types of data and tasks, ways to define the architecture, and so on
- Numerous methods to engineer loss functions
- Numerous ways to implement regularization

Problem-Centric Approach:

- Always start with the problem at hand: Analyze the nature of input data and desired output
- Choose a network architecture that aligns with the type and structure of your data
- Select a loss function that reflects the objective of the problem
- Metrics should be chosen based on what measures success for your specific task

Hyperparameter Tuning:

- Once the architecture and loss function are set, proceed to tune hyperparameters including network structure, optimizers, regularization, etc.
- Hyperparameter tuning should be guided by the chosen metrics and the nature of the problem
